

Customer Journey Map

Date	15 July 2026
Team ID	
Project Name	SkillEcho — Voice-Based Concept Understanding Analyser (VBCUA)
Maximum Marks	2 Marks

Customer Journey Map

Maps the Student's end-to-end experience on SkillEcho — actions, touchpoints, thoughts, and feelings — across three stages, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1: Discover & Onboard	Stage 2: Record & Evaluate	Stage 3: Review & Grow
Actions <i>What does the customer do?</i>	● Navigates to the SkillEcho URL and registers (name, email, password). ● Logs in and browses available reference concepts. ● Optionally opens the reference PDF to prepare.	● Selects a concept and records a spoken explanation via the audio widget. ● Reviews the recording, then submits it for evaluation. ● Waits through the AI pipeline (Whisper → NLP → scoring).	● Views the scorecard, metric breakdown, and transcript. ● Downloads the PDF evaluation report. ● Revisits the History page to compare past attempts.
Touchpoint <i>What part of the service do they interact with?</i>	● Registration form ● Login form ● Concept dropdown / list	● Audio recorder widget ● Submit button ● Loading spinner during AI processing	● Results dashboard / scorecard ● Download-PDF button ● History table
Customer Thought <i>What is the customer thinking?</i>	● “Will this be easy to sign up for?” ● “Which concept should I pick?” ● “Let me check the reference material first.”	● “I hope I explain this clearly.” ● “Did I cover everything I needed to?” ● “How long is this going to take?”	● “Is this score fair?” ● “What do these metrics actually mean?” ● “Am I improving over time?”
Customer Feeling <i>What is the customer feeling?</i>	● Neutral ● Anticipation ● Curiosity	● Focus / Nervousness ● Self-assessment ● Anticipation while waiting	● Satisfaction or concern (score-dependent) ● Relief on completion ● Reflective / growth-minded
Process Ownership <i>Who is in the lead on this?</i>	● Streamlit Frontend (app.py) + Auth API	● Backend evaluation pipeline (speech.py, audio.py, nlp.py, scoring.py)	● Results dashboard + reports.py + History API
Opportunities <i>How can we improve this stage?</i>	● Add guided onboarding tips for first-time students. ● Preview concept difficulty before selection. ● Allow saving a draft concept choice.	● Show a live audio level meter while recording. ● Add estimated wait-time messaging during processing. ● Allow re-recording without losing the session.	● Add trend charts across History entries. ● Let students annotate or bookmark strong attempts. ● Offer improvement tips tied to the weakest metric.

Emotional Journey Curve

Stage	Emotion Level	Description
Authentication	Neutral	Standard sign-up / login flow.
Concept Selection	Curious	Student explores available topics.
Audio Recording	Nervous	Performance anxiety — being evaluated by AI.
Submission	Anticipation	Waiting for results.
AI Processing	Patient / Anxious	Loading spinner; ~15–25 second wait.
Results Displayed	Variable	Positive if strong score; motivating if moderate; actionable if poor.
PDF Download	Satisfied	Tangible artefact of the evaluation.
History Review	Reflective	Tracking improvement over time.

Pain Points and Mitigation

Journey Pain Point	Mitigation Strategy
Long AI processing wait (~15–25s)	Loading spinner with progress messages; subprocess isolation prevents UI freeze.
Audio recording anxiety	Concept reference text and PDF remain visible during recording for preparation.
Unclear scoring criteria	PDF report includes a metric-interpretation column explaining each score component.
No re-attempt option visibility	History page shows all past attempts, encouraging iterative improvement.
